

Power BI Report Summary – Maven Toys Sales Dashboard

Challenge

Maven Toys needed a clear and interactive way to analyze sales performance across multiple stores and product categories. The existing data was stored in separate CSV files (sales, products, stores, and calendar) with no unified structure or easy method to track key metrics such as orders, revenue, and profit. The challenge was to connect, organize, and visualize this data in a way that supports fast, data-driven decision-making.

Approach & Techniques

To solve this, a Power BI dashboard was developed that combines data integration, modeling, and visualization techniques. Data from all sources was connected, cleaned, and structured into a unified model. Relationships between sales, products, stores, and calendar tables were established, and key measures such as total orders, total revenue, and profit were created using DAX. The dashboard design was planned in Figma, ensuring a clean, intuitive layout with KPI cards, bar and line charts, and interactive filters.

Outcome & Benefits

The final Power BI dashboard provides a single source of truth for Maven Toys' sales insights. It enables faster, data-driven decisions and highlights key business trends. Benefits include centralized reporting, real-time visibility into performance, and the ability to identify top-performing products and stores. A professionally designed layout created with Figma enhances clarity and engagement for end users.

In summary, the project transformed disconnected data files into a modern, insight-driven Power BI dashboard that empowers Maven Toys to monitor performance effectively and make informed strategic decisions.
